

Vulnerability Announcement

PeopleSoft PeopleTools Database Upload Vulnerability

Overview

The I-Assure Vulnerability Research Team (VRT) has discovered several, previously unpublished vulnerabilities in the PeopleSoft (Oracle) PeopleTools application. PeopleTools provides you the power and flexibility to enhance, deploy, and extend your PeopleSoft and non- PeopleSoft applications.

Our proactive VRT can assess your application for vulnerabilities before you fall victim to information disclosure or hacking activities. We utilize our experience and knowledge of system/application security to perform our assessment. We do NOT solely rely on automated tools to perform our assessment.

```
Bugtraq ID: None
Class: None
CVE: CVE-MAP-NOMATCH
Remote: Yes
Local: No
```

Description

LONGCHAR and VARCHAR fields allow potentially large amounts of data to be uploaded. These fields default to the maximum allowed size for their data type established on the database.

Vendor Solution

The database can be configured to limit the size of these data types, however, this should be tested to assess the impact to the application. Consider also looking at modifying the field definitions within the Application. Restricting size with the field definition would prevent using these LONG fields to upload large amounts of data. Note that making any changes to the delivered application is considered to be a customization beyond the scope of the Global Support Center. Make sure and take a backup of the data before making such changes.
